November 2019 Edition
Dörken Systems Inc. – Leading Through Technical Competence

Dörken delivers innovative, high-performance air and moisture barriers for commercial and residential construction sold under the DELTA® brand name. A North American manufacturer based out of Beamsville, Ontario, Dörken Systems Inc. is a subsidiary of Ewald Dörken AG, a leading European developer and manufacturer of waterproofing and drainage products sold worldwide. Dörken is known for delivering premium products while providing educational programs and full technical support. For more information, call +1 (888) 433-5824 or visit www.dorken.com.

Introduction

What you will find in this guide

This technical guide provides an overview of the design and construction of complete air barrier systems using DELTA®-VENT SA with vapor permeable continuous exterior insulation for low- and mid-rise (up to six stories) wood framed buildings in continental North America.

An air barrier system (air control layer) is a critical component for high performance enclosures and is required in all climates to control airflow through the building enclosure. It also defines the location of the pressure boundary of the enclosure. An exterior air barrier system is preferred since fewer penetrations need to be accommodated and it is more easily inspected. An exterior air barrier system can be constructed using outer layers of sheathing (such as gypsum, waferboard, or fiberboard) with a fully adhered membrane like DELTA®-VENT SA.

Continuous exterior insulation protects the membrane from failure at joints caused by thermal expansion and contraction. It also increases building durability and comfort by mitigating issues associated with thermal bridging and condensation in the interior wall cavity. Vapor permeable continuous exterior insulation is recommended in conjunction with the vapor permeable DELTA®-VENT SA to allow for drying of the wall assembly.

DELTA®-VENT SA is a self-adhered water-resistant membrane and air barrier component. DELTA®-VENT SA exceeds the most stringent requirements of the Air Barrier Association of America (ABAA D-115-010), the National Air Barrier Association (NABA), and of the National Building Code of Canada (NBC 2010) based on the results of ASTM E2357 - 11 Standard Test Method for Determining Air Leakage of Air Barrier Assemblies.

This guide uses the principles of building science to highlight the use of DELTA®-VENT SA and other DELTA® products with vapor permeable continuous exterior insulation to meet the needs of high performance buildings.
Improved Heat Flow Control

Thermal Performance

Many concerns, including the rising cost of energy, climate change, and demands for increased comfort, have led to the desire for increased insulation levels in new and existing buildings. Building codes are changing to require higher levels of thermal performance than ever before. Besides increasing nominal thermal resistance requirements, codes are requiring more effective performance. The following sections explain why continuous exterior insulation is a key strategy to enhancing thermal performance and how it can improve wall durability. Considerations for cladding attachment, assembly variations, and LEED credit opportunities are also provided.

Thermal Bridging

Heat flow is often greater at corners, window frames, parapets, intersections between different assemblies, etc. This is a result of requiring additional structural elements, which are frequently more thermally conductive than insulation material. The term “thermal bridge” is used to reflect the fact that heat bypasses the thermal insulation (see Figure 1). Continuous exterior insulation limits thermal bridging through structural elements in the wall cavity. This reduces the accompanying excessive heat loss which leads to cold interior surfaces that can cause discomfort and surface condensation (Figure 2).

Figure 1: Thermal bridges can cause localized drops in temperature during cold weather, resulting in condensation, mold growth, and staining. When large or intense (i.e., highly conductive), they can affect the total heat loss through the enclosure.

Figure 2: Illustration of reduction in locals drops in temperature from application of 2” continuous exterior insulation.
Improved Attachment Of Cladding

Attachment of Cladding

The use of thick (i.e., greater than 1.5”) requires an additional mechanism for cladding attachment, the selection of which is an important consideration, since it can result in thermal bridging that influences the overall thermal performance of the enclosure. Several factors influence the cladding attachment design, including the cladding weight and wind loads, which affect attachment type and spacing.

For lightweight cladding, it is recommended that cladding be attached to furring strips, and that long screws be used to attach furring strips to the framing structure. This reduces thermal bridging and allows the continuous exterior insulation to retain its insulation value while also providing a drainage and ventilation gap to remove water penetrating and absorbed by the cladding. For heavier cladding, fiberglass clips are recommended.

Figure 3 provides the relative effectiveness of different cladding attachments for 2” to 8” of continuous exterior insulation.

Figure 4: (a) Wood furring strips installed with screws for attachment of cladding over DELTA®-VENT SA (Refer to Detail 04 and Detail 06) and (b) Cascadia Clips® installed over DELTA®-VENT SA.
Improved Heat Flow Control

Convective Loops and Wind Washing

Air barriers stop airflow moving across the enclosure and are key to ensuring indoor air quality, comfort, and resistance to condensation. However, convective loops can cause air movement within the enclosure, either through low-density insulation or in spaces around insulation, and can reduce the insulation's effectiveness (Figure 5). Wind-driven flow of cold outdoor air through low-density insulation or air gaps in exterior continuous insulation (known as “wind washing”) can also cool the interior side of the enclosure, resulting in condensation (Figure 6). Such condensation promotes mold growth which, in turn, affects indoor air quality and durability.

Continuous exterior insulation with adequate density keeps the sheathing warm, which reduces the risk of condensation caused by convective loops in cavity insulation. Recent research¹ has shown that wind washing effect can vary significantly depending on specific project circumstance for unprotected mineral wool exterior insulation behind cladding.

Improved Condensation Control

Control of air leakage through the enclosure is important for avoiding condensation and the associated issues of enclosure durability and occupant health problems.

Use of continuous exterior insulation can be very effective in controlling condensation (see Figure 2). Outward air leaking may cause water and frost condensation on surfaces within the enclosure that are colder than the dew point of the exfiltrating indoor air. Sufficient exterior insulation, relative to the amount of interior insulation, will keep the sheathing and other surfaces above the dew point. Controlling the temperature and relative humidity within a building during cold weather is also critical. Interior temperatures often range 20-22 °C (68-72 °F), but relative humidity levels can vary significantly.

Table 1 provides the level of insulation (including sheathing, air space and cladding) that should be provided outside of an air permeable insulation (i.e., batt or blown fibrous insulation) filled stud space to prevent cold-weather condensation. Mild temperatures and dry interior air require less exterior insulation to control condensation, whereas a 50 %RH (a very high cold-weather interior humidity) in a cold climate should have virtually all the insulation on the exterior.

Vapor diffusion is a separate process that can also cause condensation. If the sheathing layers are highly vapor permeable (e.g., EPS, stone wool over fiberboard, gypsum sheathing, and vapor permeable air- and water-resistive membranes) then concerns of vapor diffusion are lessened, if not eliminated. Moisture flow due to air leakage tends to be much greater than moisture flow due to vapor diffusion. Hence, the airflow control and proper use and levels of insulation are still important for condensation control in such assemblies. If an assembly is safe against air leakage condensation based on insulation ratios, then it will also be safe from vapor diffusion condensation, regardless of the sheathing vapor control layer.

For important projects or situations in which the design team has little historical experience, investigation using widely available hygrothermal computer models would be prudent.

Recommendations for Thermal Control by Climate

North American Climate Zones

The enclosure design must be adapted depending on the climate. Use Figure 8 below to determine the climate zone in which the project is located and refer to Table 2, Table 3, and Table 4 in the following sections for details on climate-specific thermal control and selection of enclosure materials and components.

**Zone 1**  Very Hot with 5000 < CDD10 °C (9000 < CDD50 °F)

**Zone 2**  Hot with 3500 < CDD10 °C ≤ 5000 (6300 < CDD50 °F ≤ 9000)

**Zone 3**  Warm with 2500 < CDD10 °C < 3500 (4500 < CDD50 °F ≤ 6300)

**Zone 4**  Mixed with CDD10 °C ≤ 2500 & HDD18 °C ≤ 3000 (CDD50 °F ≤ 4500 & 3600 < HDD65 °F ≤ 5400)

**Zone 5**  Cool with 3000 < HDD18 °C ≤ 4000 (5400 < HDD65 °F ≤ 7200)

**Zone 6**  Cold with 4000 < HDD18 °C ≤ 5000 (7200 < HDD65 °F ≤ 9000)

**Zone 7**  Very Cold with 5000 < HDD18 °C ≤ 7000 (9000 < HDD65 °F ≤ 12600)

**Zone 8**  Subarctic with 7000 < HDD18 °C (12600 < HDD65 °F)

Climate-Specific Recommendations for Insulation

The amount of thermal control required varies by climate. Table 2 summarizes the total effective R-value of various enclosure assemblies that are recommended for a low-energy, highly comfortable building. It is noted that these recommendations are for buildings with relative low internal heat gains (e.g. residential buildings). These R-values can be provided entirely by exterior insulation, or, if a vapor permeable air- and water-resistive membrane is used, by some combination of framing cavity and exterior insulation. Table 3 provides a guide for the thickness of exterior insulation by climate zone for the wall if framing cavity insulation is utilized.

</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Recommendation: In cold climates (Zones 5-8), DELTA®-VENT SA can be used on walls that employ a low permeance interior vapor control layer (vapor barrier). Provided sufficient exterior insulation is provided, no interior vapor barrier is required.</td>
</tr>
</tbody>
</table>

Table 4: Selection Guide for DELTA®-VENT SA

Cladding should be installed over a drained and ventilated space, especially when using absorptive claddings. With DELTA®-VENT SA, vapor permeable exterior insulation is recommended and in all cases should be installed over a sheathing membrane that is detailed as a drainage plane/water-resistive barrier.

Vapor permeable latex paint and kraft paper should be used in hot climates (Zones 1-4) and not vinyl wall coverings or polyethylene vapor retarders. To avoid issues with condensation from both inward and outward vapor drives, the vapor permeance of individual layers, and the amount of exterior continuous insulation should be balanced carefully in Zones 5-8. For instance, solar inward vapor drives caused by rain wetted cladding and solar energy can cause moisture accumulation inside the enclosure, particularly at low vapor permeance layers, potentially causing mold growth and other durability issues. For absorptive claddings with high rain and solar exposure, alternative less permeable insulation or membrane products may be necessary to limit moisture transfer or use of interior smart vapor barriers.

LEEDv4 has design-based green rating systems that include the building enclosure within their scope in terms of various environmental impacts. LEEDv4 includes the following rating systems for midrise buildings (USGBC.org).

**Homes and Multifamily Lowrise**: Designed for single family homes and multifamily buildings between one and three stories.

**Multifamily Midrise**: Designed for midrise multifamily buildings between four and eight stories.

The standards similarly define green building features in terms of prerequisite and point earning requirements. When all prerequisites are fulfilled and a minimum number of points are achieved, a project can receive a certified silver, gold, or platinum rating. Also, it is important to note that the standards are evolving. Below is an overview of how DELTA®-VENT SA affects specific credit opportunities within the current LEEDv4 rating systems.

<td>Up to 20</td>
<td>Option 2 – Prescriptive compliance&lt;br&gt;Projects must meet the prescriptive requirements of the ASHRAE Advanced Energy Design Guides (50% savings required for LEED v4). These guides have similar air barrier requirements as ASHRAE 90.1-2010 under which DELTA®-VENT SA can serve as an effective continuous air barrier. Homes&lt;br&gt;Homes must meet minimum Energy Star performance requirements that include blower door performance thresholds. Houses using DELTA®-VENT SA have been found to achieve exemplary air tightness performance. For projects following the Energy Star performance path, additional points are available for a more air tight house.</td>

**Compartmentalization**<br>PR<br>Multifamily Midrise<br>For multi-residential buildings 4-6 stories, the Multifamily Midrise requires all projects meet compartmentalization requirements for units, regardless of smoking policy. This is confirmed through unit blower door testing which captures interior separation between units and the exterior enclosure.

This standard also provides additional point(s) for exceeding suite air tightness thresholds in the Enhanced Compartmentalization credit. Using DELTA®-VENT SA will ensure minimum air leakage contribution of the exterior enclosure.

Table 5: Summary of How DELTA®-VENT SA Contributes to LEEDv4
Details List

The following drawings illustrate common construction details for low- mid-rise wood framed wall assemblies with continuous permeable exterior insulation. The drawings are not project-specific and are meant to be modified by the project architect to include selected cladding, structural components, and other construction materials. Each drawing, however, clearly labels assembly elements by function and includes a description of each detail and building science notes. The following details are included in this guide:

Building Science Note

**DELTA®-VENT SA with Continuous Exterior Insulation:**

**Building Science Notes**

1. **General**
   - a. Detail is applicable to lightweight cladding systems (see 07.b below) using exterior insulation for low- and mid-rise residential or light commercial construction.

2. **Structure**
   - a. A 2x4, 2x6 or 2x8 wood stud frame and exterior oriented strand board (OSB) or plywood sheathing infill structure with and without a plywood extension box is illustrated in design options A and B, respectively.

3. **Rainwater control layer**
   - a. A drained-screen approach to rainwater control (as illustrated) is recommended.
   - b. The continuous, fully adhered DELTA®-VENT SA membrane is the primary rainwater control layer in the wall assembly. It is applied to the exterior surface of the exterior OSB or plywood sheathing.

4. **Air control layer**
   - a. The continuous, fully adhered DELTA®-VENT SA membrane is the primary air control layer. It is applied to the exterior surface of the exterior OSB or plywood sheathing. The membrane is fully supported by the exterior sheathing and continuous through the detail illustrated.

5. **Thermal control layer**
   - a. 3” to 6” continuous exterior insulation is the primary thermal control layer (addressing thermal bridging). Insulation may also be included in the wall cavity.
   - b. The recommended amounts of insulation vary by climate region (see Table 2 and Table 3).

6. **Vapor control layer**
   - a. Depending on climate and insulation materials, the primary vapor control layer may be located at the wall interior (see Table 4).
   - b. Design the assembly as a vapor-open assembly, if applicable, meaning that there is a single plane of vapor control and that drying can occur toward the interior or toward the exterior from this plane. Selection of vapor-open interior finishes should be considered.
   - c. In hot climates (Zones 1-4), do not install a vapor permeable sheathing membrane on a wall that employs a low permeance interior vapor control layer, especially when using a moisture absorptive cladding.

7. **Exterior cladding**
   - a. Lightweight cladding is illustrated,
   - b. Material options for lightweight exterior cladding include:
     - I. Wood or wood panel
     - II. Fiber cement siding or panels
     - III. Vinyl siding
     - IV. Aluminum siding

8. **Quality control considerations**
   - a. Inspect the lapping of membrane pieces to ensure that pieces are installed in “shingle” fashion.
   - b. Confirm installation of DELTA®-MULTI BAND tape at vertical edges of DELTA®-VENT SA membrane sheets.
   - c. Ensure tight fit of continuous exterior insulation material at all penetrations.
   - d. Ensure strapping is fastened through insulation into structural member.
1. Punched Window Opening – Sill Detail

**Design Option A**

- DELTA®-FLASHING sill flashing. Overlap vertical DELTA®-VENT SA
  min 2" (50 mm)*
- Window sill extensions with sealant to allow drainage over window sill
- 3/4" plywood window buck extends to outside face of insulation
- Continuous thermal insulation (XPS, EPS, PIC or semi-rigid MFI)
- Finished cladding over 3/4" vertical furring strips
- DELTA®-VENT SA fully adhered air and water-resistive barrier

**Design Option B**

- Double-glazed vinyl, wood, or fiberglass framed window with nailing flange
- Window sill extensions with sealant to allow drainage over window sill
- Continuous thermal insulation (XPS, EPS, PIC or semi-rigid MFI)
- Finished cladding over 3/4" vertical furring strips
- DELTA®-VENT SA fully adhered air and water-resistive barrier

* Do not install fasteners through sill membrane

- Double-glazed vinyl, wood, or fiberglass framed window, anchored at jamb and head with metal strap
- Backdam installed with framing; alternate install sloped sill
- Low expansion spray foam or sealant connects DELTA®-VENT SA air barrier to window. Do not seal full cavity to allow drainage from sill flashing
- Cavity insulation (fiberglass batt, cellulose, ocSPF) and vapor control as required (see "Vapor Control")
- Metal angle backdam
- Provide spacers at sill to allow for drainage
- Cavity insulation (fiberglass batt, cellulose, ocSPF) and vapor control as required (see "Vapor Control")
2. Punched Window Opening – Jamb Detail

Design Option A

- Cavity insulation (fiberglass batt, cellulose, ocSPF) and vapor control as required (see "Vapor Control")
- 2 x 4 blocking for attachment of furring behind window trim
- DELTA®-VENT SA fully adhered air and water-resistive barrier
- Continuous thermal insulation (XPS, EPS, PIC or semi-rigid MFI)
- Finished cladding over 3/4" vertical furring strips
- Metal strap anchor connects window frame to wood structure
- Double-glazed vinyl, wood, or fiberglass framed window with nailing flange
- Low expansion spray foam or sealant with backer rod (depending on the size of the space between the window and the rough opening) connects DELTA®-VENT SA air barrier to window. Do not seal full cavity to allow drainage from sill flashing
- DELTA®-VENT SA wraps edge of window buck

Design Option B

- Cavity insulation (fiberglass batt, cellulose, ocSPF) and vapor control as required (see "Vapor Control")
- 2 x 4 blocking for attachment of furring behind window trim
- DELTA®-VENT SA fully adhered air and water-resistive barrier
- Continuous thermal insulation (XPS, EPS, PIC or semi-rigid MFI)
- Window flange taped with DELTA®-MULTI-BAND
- Finished cladding over 3/4" vertical furring strips
- Double-glazed vinyl, wood, or fiberglass framed window with nailing flange
- Low expansion spray foam or sealant with backer rod (depending on the size of the space between the window and the rough opening) connects DELTA®-VENT SA air barrier to window. Do not seal full cavity to allow drainage from sill flashing
3. Punched Window Opening – Head Detail

Design Option A

- DELTA®-VENT SA fully adhered air and water-resistant barrier
- Finished cladding over 3/4" vertical furring strips
- Head flashing drip edge in cladding at window head trim
- DELTA®-MULTI-BAND seals top edge of metal flashing to DELTA®-VENT SA
- Metal flashing with drip edge
- Backer rod and caulking at window head
- Continuous thermal insulation (XPS, EPS, PIC or semi-rigid MFI)
- DELTA®-VENT SA wraps edge of window buck
- Cavity insulation (fiberglass batt, cellulose, ocSPF) and vapor control as required (see "Vapor Control")
- Metal strap anchor connects window frame to wood structure
- Low expansion spray foam or sealant with backer rod (depending on the size of the space between the window and the rough opening) connects DELTA®-VENT SA air barrier to window.
- Double-glazed vinyl, wood, or fiberglass framed window, anchored at jamb and head with metal strap

Design Option B

- DELTA®-VENT SA fully adhered air and water-resistant barrier
- Finished cladding over 3/4" vertical furring strips
- DELTA®-MULTI-BAND seals top edge of metal flashing to DELTA®-VENT SA
- Continuous thermal insulation (XPS, EPS, PIC or semi-rigid MFI)
- Metal flashing with drip edge
- Cavity insulation (fiberglass batt, cellulose, ocSPF) and vapor control as required (see "Vapor Control")
- Low expansion spray foam or sealant with backer rod (depending on the size of the space between the window and the rough opening) connects DELTA®-VENT SA air barrier to window.
- Double-glazed vinyl, wood, or fiberglass framed window with nailing flange
4. Punched Window Opening Option A – Installation Sequence

- **Step 1**
  - Wood frame with OSB or plywood sheathing.

- **Step 2**
  - Install plywood/OSB window extension box inside rough opening to support window installation.

- **Step 3**
  - Prime sheathing with DELTA*-HF PRIMER before applying DELTA*-VENT SA*.
  - Install DELTA*-VENT SA membrane below window and up over extension box.

- **Step 4**
  - Install DELTA*-VENT SA membrane to both sides of jamb, lapping minimum 4" (100 mm) over bottom sheet. Membrane should continue to cover interior sides of extension box.

*Use DELTA*-ADHESIVE LVC when temperatures are at 41 °F (5 °C) or below.*
Installation Details

4. Punched Window Opening Option A – Installation Sequence

- Install DELTA®-VENT SA membrane at head of rough opening. Lap minimum 4" (100 mm) onto face of wall at head.

- Install DELTA®-MULTI-BAND tape at overlapped edges of DELTA®-VENT SA to ensure airtightness.
- Install DELTA®-FLASHING membrane to sill.

- Continuous vapor permeable thermal insulation (EPS, semi-rigid stonewool), installed in two layers, joints offset and staggered.

- Install window with metal strap anchors to interior of window extension box.
- Install 1x4 wood furring strips to support window trim and cladding.

- Install metal flashing to the strapping above the top trim board.

- Install window trim.

- Install siding.
5. Punched Window Opening Option B – Installation Sequence

**Step 1**
- Wood frame with OSB or plywood sheathing. Prime sheathing with DELTA®-HF PRIMER before applying DELTA®-VENT SA*.

**Step 2**
- Install flexible plastic corner DELTA®-FAS CORNER to ensure reliable draught- and waterproof seals.

**Step 3**
- Install DELTA®-VENT SA membrane to lower portion of wall.

**Step 4**
- Install DELTA®-VENT SA membrane to upper portion of wall, lapsing minimum 4" (100 mm).

*Use DELTA®-ADHESIVE LVC when temperatures are at 41 °F (5 °C) or below.
Use the "upside-down martini glas" method to cut into DELTA®-VENT SA membrane.

Carefully fold back the sections of DELTA®-VENT SA towards the inside of the window opening.

Install DELTA®-FLASHING membrane to sill.

Install metal back damn back edge of window opening. Seal with DELTA®-THAN or DELTA®-TILAXX.
Installation Details

5. Punched Window Opening Option B – Installation Sequence

Step 9
- Install window.

Step 10
- Install DELTA®-MULTI-BAND tape at window edges starting with jamb to ensure proper lapping. Do not tape at window sill to allow for drainage.

Step 11
- Install continuous insulation.

Step 12
- Install 1x4 wood strapping to support siding.
Step 13
- Install window trim.

Step 14
- Install header flashing against insulation.

Step 15
- Install siding.
6. **Field of Wall – Exterior Entry Door – Sill Detail**

- **Door frame**
- **Shim**
- **DELTA®-FLASHING sill flashing** installed over door sill and overlap DELTA®-VENT SA at door buck to direct draining water over the front face of rigid insulation
- **Concrete precast step**
- **Floor finish**
- **Low expansion spray foam or sealant with backer rod (depending on the size of the space between the window and the rough opening) connects DELTA®-VENT SA air barrier to door**
- **Metal angle as backdamp**
- **Cavity insulation (fiberglass batt, cellulose, ocSPF) and vapor control as required (see "Vapor Control")**
- **Plywood extension box**
- **DELTA®-VENT SA fully adhered air and water-resistant barrier**
- **1" minimum continuous thermal insulation (over 2 x 6 wood blocking)**
7. **Field of Wall – Exterior Entry Door – Jamb Detail**

- Cavity insulation (fiberglass batt, cellulose, ocSPF) and vapor control as required (see "Vapor Control")
- 2 x 4 blocking for attachment of furring behind window trim
- Continuous thermal insulation (XPS, EPS, PIC or semi-rigid MFI)
- DELTA®-VENT SA fully adhered air and water-resistant barrier
- Finished cladding over 3/4" vertical furring strips
- Interior door trim
- Door frame
- Shim
- Low expansion spray foam or sealant with backer rod (depending on the size of the space between the window and the rough opening) connects DELTA®-VENT SA air barrier to door
- 3/4" plywood door extension box to outside face of insulation
- DELTA®-VENT SA wraps edge of door buck

8. **Field of Wall – Exterior Entry Door – Head Detail**

- Finished cladding over 3/4" vertical furring strips
- DELTA®-VENT SA fully adhered air and water-resistant barrier
- DELTA®-MULTI-BAND seals top edge of metal flashing to DELTA®-VENT SA
- Metal flashing with drip edge
- Continuous thermal insulation (XPS, EPS, PIC or semi-rigid MFI)
- DELTA®-VENT SA wraps edge of door buck
- Low expansion spray foam or sealant with backer rod (depending on the size of the space between the window and the rough opening) connects DELTA®-VENT SA air barrier to door
- Interior door trim
- Shim
- Door frame
- 3/4" plywood door extension box to outside face of insulation
9. **Field of Wall – Exterior Entry Door – Sequence**

**Step 1**
- 2x4 wood frame with OSB or plywood sheathing.

**Step 2**
- Install plywood extension box.

**Step 3**
- Prime sheathing with DELTA®-HF PRIMER before applying DELTA®-VENT SA.*

**Step 4**
- Install DELTA®-VENT SA membrane to both sides of jamb and wrap extension box.

*Use DELTA®-ADHESIVE LVC when temperatures are at 41 °F (5 °C) or below.*
- Install DELTA®-VENT SA membrane at head. Lap minimum 4” (100 mm) onto face of wall sheathing at head.

- Install DELTA®-MULTI-BAND tape at overlapped edges of DELTA®-VENT SA to ensure airtightness.

- Install 3”-6” continuous vapor permeable thermal insulation (EPS, semi-rigid stonewool), installed in two layers, joint offset and staggered.
Installation Details

9. Field of Wall – Exterior Entry Door – Sequence

- Install 2 2x8 wood filler to support door threshold. Cover with 1" continuous thermal insulation (EOS, semi-rigid stonewool).

- Install 1/2" aluminium back dam support angle and 2nd layer of self-adhered membrane flashing.

- Install door and back caulk around frame.

- Install door trim and trim extensions.
Step 13

Install metal flashing to the face of insulation above trim board.

Step 14

Install siding.
10. Field of Wall – Mechanical or Electrical Penetration

- Cut opening in exterior sheathing, ensuring that the penetration fits with a small gap on all sides.
- Install DELTA®-FLEXX-BAND below penetration, forming the material tightly to the penetration.
- Install a second piece of DELTA®-FLEXX-BAND above, overlapping the lower flashing and sealing tightly. Apply DELTA®-THAN sealant from interior.

Installation Details

- DELTA®-VENT SA fully adhered air and water-resistive barrier
- DELTA®-FLEXX-BAND flashing installed in two pieces, bottom first and then top (illustrated below)
- Finished cladding over 3/4" vertical furring strips
- Continuous thermal insulation (XPS, EPS, PIC or semi-rigid MFI)
- Cavity insulation (fiberglass batt, cellulose, ocSPP) and vapor control as required (see "Vapor Control")
- Install DELTA®-THAN sealant around penetration from interior
- Gypsum board finish
11. Intersection of Wall to Second Floor

- DELTA®-VENT SA fully adhered air and water-resistive barrier
- Continuous thermal insulation (XPS, EPS, PIC or semi-rigid MFI)
- Optional mid wall flashing and movement joint
- Finished cladding over 3/4" vertical furring strips
- Cavity insulation (fiberglass batt, cellulose, ocSPF) and vapor control as required (see "Vapor Control")
- Interior floor finish
- Gypsum board finish
12. Intersection – Wall and Cantilevered Balcony

- DELTA®-VENT SA fully adhered air and water-resistant barrier
- DELTA®-BUG SCREEN at base of ventilated cavity
- Deck membrane extends min. 8” (200 mm) up wall overlapped by DELTA®-VENT SA
- Pre-finished metal cap over removable insulation block. Maintain minimum 6” separation between cladding and deck.
- Continuous thermal insulation (XPS, EPS, PIC or semi-rigid MFI)
- Cavity insulation (fiberglass batt, cellulose, ccSPF) and vapor control as required (see "Vapor Control")
- Solid blocking between cantilever framing serves as backing for backing for ccSPF
- 2.0 pcf ccSPF insulation to make the air barrier continuous from the 1 x 3 blocking to the underside of the deck sheathing. Insulation depth to match thermal resistance requirements for wall assembly.
- Slope deck min. 2%. If possible, create a step down to the balcony to reduce risk of water intrusion at the through-wall flashing location.
- Exterior deck on 1.5” sleepers sloped to drain
- Wood cant block
- DELTA®-VENT SA on the wall assembly sealed to a 1 x 3 or equivalent block nailed to underside of cantilevered deck framing. Ensure a minimum of 2” horizontal area of adhesion of membrane
- Exterior deck on 1.5” sleepers sloped to drain
13. Intersection of Wall to Second Floor – Soffit Under Cantilevered Floor

- DELTA®-VENT SA fully adhered air and water-resistive barrier
- Continuous thermal insulation (XPS, EPS, PIC or semi-rigid MFI)
- Finished cladding over 3/4” vertical furring strips
- Metal drip edge
- Solid blocking, sealant applied to four sides to complete air seal
- Interior floor finish
- Cavity insulation (fiberglass batt, cellulose, ocSPF) and vapor control as required (see “Vapor Control”)
- DELTA®-VENT SA fully adhered air and water-resistive barrier
Installation Details

14. Intersection of Wall to Roof – Pitched Roof, Vented Assembly

- Asphalt composite shingles (shown), or other approved roof cladding
- DELTA®-VENT S synthetic roof underlayment
- Baffle between trusses to hold insulation and maintain vent space under roof sheathing
- Vented soffit panel
- DELTA®-VENT SA fully adhered air and water-resistive barrier
- Continuous thermal insulation (XPS, EPS, PIC or semi-rigid MFI)
- Finished cladding over 3/4" vertical furring strips
- Sealant applied between exterior shathing and framing, and interior gypsum board and framing to maintain air barrier continuity
- Loose-laid insulation (stone wool, fiberglass batt, blown cellulose for fiberglass) and vapor control as required (see “Vapor Control”)
- Cavity insulation (fiberglass batt, cellulose, ccSPF) and vapor control as required (see “Vapor Control”)
- Gypsum board ceiling (air control layer in attic assembly)
- Baffle between trusses to hold insulation and maintain vent space under roof sheathing
15. Intersection of Wall to Roof – Pitched Roof, Unvented Assembly

- Asphalt composite shingles (shown), or other approved roof cladding
- DELTA®-VENT S synthetic roof underlayment
- 2” 2.0pcf ccSPF installed against blocking and underside of roof deck to continue air barrier. Remainder of rafter cavity filled with batt insulation.
- OSB or plywood extends between rafters to hold exterior insulation and provide blocking of ccSPF insulation
- DELTA®-VENT SA fully adhered air and water-resistive barrier
- Continuous thermal insulation (XPS, EPS, PIC or semi-rigid MFI)
- Finished cladding over 3/4” vertical furring strips
- Cavity insulation (fiberglass batt, cellulose, ocSPF) and vapor control as required (see “Vapor Control”)
16. Intersection – Wall and Low-Slope Roof Parapet

- Parapet cap flashing with drip edge
- Insulated parapet cap
- DELTA®-VENT SA fully adhered air and water-resistive barrier laped min. 3” to underside of parapet cap
- Air barrier membrane at roof deck level is installed and wrapped over wall sheathing prior to installation of parapet. Installation of DELTA®-VENT SA over membrane achieves air barrier continuity.**
- Continuous thermal insulation (XPS, EPS, PIC or semi-rigid MFI)
- DELTA®-VENT SA fully adhered air and water-resistive barrier
- Finished cladding over 3/4” vertical furring strips
- Fully-adhered roof membrane wraps over parapet
- Perimeter of roof insulation wrap in air barrier to block airflow from roof to parapet
- Min. two (2) layers of insulation, joints staggered horizontally in both directions
- Slope to drain min. 2%
- ccSPF in 1” (25 mm) or 2” (50 mm) thickness for thermal control at inside or roof edge
- Cavity insulation (fiberglass batt, cellulose, ccSPF) and vapor control as required (see "Vapor Control")

** Isolation of parapet avoids humid indoor air penetration and condensing within parapet assembly.
17. Intersection of Wall to Slab-on-Grade

- Cavity insulation (fiberglass batt, cellulose, ocSPF) and vapor control as required (see "Vapor Control")
- Foam gasket as capillary break and air seal between foundation and wood framing
- DELTA®-VENT SA fully adhered air and water-resistive barrier
- Finished cladding over 3/4" vertical furring strips
- Continuous thermal insulation (XPS, EPS, PIC or semi-rigid MFI)
- Bottom of insulation wrapped with metal screen or flashing
- Protection board
- DELTA®-DRAIN over thermal insulation
- 2" (50 mm) below slab over compacted gravel base
- Polyethylene sheet wrapping grade beam and below slab as capillary break and vapor control
- Concrete grade beam
- Foundation perimeter drain with free-drainage gravel cover
- Slope grade min. 2%
- DELTA®-VENT SA fully adhered air and water-resistive barrier fully adhered to concrete foundation to maintain air and water barrier continuity
- Interior floor finish
### Installation Details

#### 18. Intersection – Wall and Foundation with Exterior Insulation

- **Slope grade min. 2%**
- **DELTA®-MS foundation protection system**
- **DELTA®-VENT SA fully adhered air and water-resistive barrier**
- **Continuous thermal insulation (XPS, EPS, PIC or semi-rigid MFI)**
- **Finished cladding over 3/4" vertical furring strips**
- **Metal flashing with drip edge**
- **Sealant air seals exterior sheathing to mud sill**
- **Cast-in-place or CMU foundation wall**

- **Cavity insulation (fiberglass batt, cellulose, ocSPF) and vapor control as required (see "Vapor Control")**
- **Interior floor finish**
- **Rim joist cavity sealed with min. 2" (50 mm) 2.0 pcf ccSPF, overlap foundation wall insulation to complete air seal (fire protection not shown)**
- **Foam gasket as capillary break and air seal between foundation and wood framing**
- **XPS, PIC (interior finish and fire protection not shown) or air sealed semi-rigid stonewool insulation**
19. Field of Wall – Cladding Attachment at Inside Corner

- Gypsum board attached with drywall clips
- Cavity insulation (fiberglass batt, cellulose, ocSPF) and vapor control as required (see "Vapor Control")
- OSB or plywood sheathing
- DELTA®-VENT SA fully adhered air and water-resistant barrier. Membrane wraps minimum 6” (150 mm) at corner
- Continuous thermal insulation (XPS, EPS, PIC or semi-rigid MFI)
- Horizontal 1 x 4 wood furring strip over first layer of insulation
- Finished cladding
- Interior corner trim

20. Field of Wall – Cladding Attachment at Outside Corner

- Gypsum board attached with drywall clips
- Cavity insulation (fiberglass batt, cellulose, ocSPF) and vapor control as required (see "Vapor Control")
- OSB or plywood sheathing
- DELTA®-VENT SA fully adhered air and water-resistant barrier. Membrane wraps minimum 6” (150 mm) at corner
- Continuous thermal insulation (XPS, EPS, PIC or semi-rigid MFI)
- Vertical 1 x 4 wood furring strip
- Finished cladding
- Interior corner trim
DELTA®-Accessories

DELTA® Air Barrier System Components

Assuring an air-tight building enclosure

Using DELTA®-VENT SA to create an energy-efficient and air-tight building is a great choice. Choosing premium DELTA® Air Barrier System Components will help complete the job to meet the highest standards.

The secret to ensuring the overall effectiveness of an air barrier system is in the details, such as sealing windows, doors and penetrations. Proper attention to details is critically important to achieve an air-tight assembly. All components must be interconnected to successfully resist air and water infiltration, and turn individual materials, components and assemblies into a complete Air Barrier System.

DELTA®-Accessories are exhaustively tested for compatibility. Together they assure superior performance in air-tight building enclosures.

DELTA®-FLASHING is a best-in-class self-adhering membrane used to flash around window and door openings. Cut in practical and convenient widths, it provides superior long-term protection against air and water leaks.

DELTA®-MULTI-BAND is a very tough and durable seam tape with an aggressive pure acrylic adhesive. It is suitable for use at end and side laps or other detail areas. It sticks tenaciously to DELTA®-VENT SA as well as all other common construction substrates like OSB, plywood, metal, glass, etc.

DELTA®-FLEXX-BAND is a two-ply stretchable tape with a premium butyl rubber adhesive for use at penetrations such as service pipes, arched windows, window flanges, corners and joints. It is formed easily by hand into irregularly-shaped areas, forming a tight bond to wood, vinyl, metal and other common building materials.

DELTA®-FAS CORNER is a unique preformed corner for sealing windows and doors in air- and water-tight construction. Both durable and UV resistant, it provides top performance in detailing energy-efficient enclosures. DELTA®-FAS CORNER is easy to use and saves both time and labor during installation.

DELTA®-THAN is a permanently elastic adhesive and sealant made with a special rubber compound. It is ideal for sealing around penetrations, terminations, etc.

DELTA®-TILAXX is a high quality permanently elastic adhesive and sealant for durable air-tight bonding to all common construction surfaces where moderate movement of components is expected.

DELTA®-ADHESIVE LVC is a low solvent surface conditioner. It consolidates surface dust on dirty construction site substrates, assuring reliable long-term air-tight adhesion for DELTA®-VENT SA.

DELTA®-HF PRIMER is a solvent-free primer suitable for most construction substrates. It is used to significantly improve the adhesion properties of surfaces such as plywood, OSB, masonry and concrete.

DELTA®-TW FLASHING is a premium, durable, self-adhering flashing designed for through-wall applications. It adheres tenaciously to seal the interface between common building substrates, including lintels and brick ledges, and to all DELTA® air- and water-resistive barrier membranes.

The comprehensive line of DELTA®-Accessories by Dörken delivers complete solutions for energy-efficient and durable building enclosures.

About Dörken Systems Inc.
Dörken delivers innovative, high-performance air and moisture barriers for commercial and residential construction sold under the DELTA® brand name. A North American manufacturer based out of Beamsville, Ontario, Dörken Systems Inc. is a subsidiary of Ewald Dörken AG, a leading European developer and manufacturer of waterproofing and drainage products sold worldwide. Dörken is known for delivering premium products while providing educational programs and full technical support.
